

FORAGE RYE (SECALE CEREALE)

BORFURO

Winter forage rye

Our varieties are particularly suited to winter intertillage production and are used as a substratum for biogas-/silage production. Important cultivation goals when dealing with fodder rye are to begin growing early in spring and to rapidly build up high dry matter yields. Fodder rye will then provide strong stocking, abundant vegetative growth and high growth length.

Advantages of BORFURO

- > Popular german variety with pronounced dry matter yields
- > Low tendency to lodging
- > Rapid tillering in autumn combined with an early growth in spring

Variety assessment of BORFURO

Mass growth at beginn of vegetation		low to high
Plant length	4	low to medium
Tendency to lodging		low to medium
Dry matter yield	5	medium
Dry matter yield Dry matter content	3	medium low to medium

(1 = very low, very early / 9 = very strong, very high, very late) Source: according to the specifying variety list 2023 issued by the Bundessortenamt
